An objectbase schema evolution approach to Windows NT security

Author: Jayapalan, Raj Kumar  
Degree: M.Sc.  
Year: 2000  
Corporate Source/Institution: The University of Manitoba (Canada) (0303)  
Advisers: Randal Peters; Ken Barker  
Source: VOLUME 39/02 of MASTERS ABSTRACTS.  
PAGE 527. 53 PAGES  
ISBN: 0-612-53109-0

A security model should be designed in such a way that it is transparent to the users, and at the same time easy to maintain and manage even if a very complex security model is required to ensure its proper functions. Schema evolution on the other hand is the timely change of the schema and the consistent management of these changes. Dynamic schema evolution (DSE) is the management of the schema changes while a system is in operation. The various schema evolution operations are similar to the security management operations. Thus this thesis proposes a new security model based on DSE that provides a flexible set of operations that will make security management easier and more understandable.

Windows NT is chosen as the test platform and the model is implemented on it. The current security model for the Windows NT operating system is powerful and offers many valuable features. The User Manager provided by Windows NT is the primary method for the provision of security maintenance. Our system supports the following features in addition to those currently available on Windows NT. (1) An object-oriented hierarchy, so roles and groups can be supported in a more automated way. (2) A more intuitive user interface so the administrative errors are less likely to be problematic. (3) Simplified security management on a Windows NT platform. (4) Avoids unnecessary creation of objects (users/group) and redundant granting/revoking of privileges.

One of the nicest features of the proposed security model is that both the system and the User Manager can operate together. Thus with the proposed model, the maintenance of the security model becomes much easier and more efficient.

Abstract: The coordinated exploitation of modern communication, micro-sensor and computer technologies makes it possible to give global reach to our senses. Web-cameras for vision, web-microphones for hearing and web-'noses' for smelling, plus the abilities to sense many factors we cannot ordinarily perceive, are either available or will be soon. Applications include (1) determination of weather and environmental conditions on dense grids or over large areas, (2) monitoring of energy usage in buildings, (3) sensing the condition of hardware in electrical power distribution and information systems, (4) improving process control and other manufacturing, (5) development of intelligent terrestrial, marine, aeronautical and space transportation systems, (6) managing the continuum of routine security monitoring, diverse crises and military actions, and (7) medicine, notably the monitoring of the physiology and living conditions of individuals. Some of the emerging capabilities, such as the ability to measure remotely the conditions inside of people in real time, raise interesting social concerns centered on privacy issues. Methods for sensor data fusion and designs for human-computer interfaces are both crucial for the full realization of the potential of pervasive sensing. Computer-generated virtual reality, augmented with real - time sensor data, should be an effective means for presenting information from distributed sensors. (10 Refs)

Abstract: Public key cryptography is widely recognised as the technology to develop effective authentication, integrity, confidentiality and non-repudiation services. The provision of public key-based **security** services for complex and large-scale organisations requires a public key infrastructure (PKI) in charge of securely **managing** cryptographic keys/ **certificates** . An essential PKI service is the **certificate** status validation (CSV) system that supports the publishing and the consistent usage of **certificate** status information for a wide range of applications. Several CSV solutions, such as **certificate** revocation lists or the Online **Certificate** Status Protocol, are available, but none can meet the requirements for all applications, in particular of timeliness and performance. The lack of a comprehensive CSV solution calls for the development of a flexible framework that can integrate all available validation mechanisms and permit the selection of alternative validation strategies, depending on application requirements. This paper describes such a framework that provides PKI users with a flexible, **dynamic** and **transparent** CSV support. In addition, the paper claims that the framework flexibility, **dynamicity** and **transparency** can greatly benefit from the adoption of mobile agent (MA) technology, because it exhibits the same intrinsic features, by presenting an MA-based prototype for CSV. Abstract: This paper studies dynamic **security** constrained congestion management in an unbundled electric power system. Making a system dynamically secure will require the re-dispatch of generators, and achieving a commercial **transparent** and technically justifiable approach, therefore, is very important. In this paper, the transient energy margin using the transient energy function approach has been applied to calculate the stability margin of the system after clearing a typical fault. Re-dispatch is undertaken if this margin is inadequate. It is possible to reschedule the real power generator along with curtailment of real power load to make the system dynamically secure after a fault. In some cases, congestion can be avoided by using a costlier generator, which increases the nodal prices of the system. In extreme cases, congestion can only be avoided by curtailment of transactions. A conceptually reasonable and computationally feasible approach for the solution of this problem has been developed and is illustrated by an example. (13 Refs)

Treatment: Practical (P)

Abstract: It is highly required to quickly detect the vulnerability of a computer network system and an appropriate action toward it should be followed as soon as possible for its security. It leads us to the need of a monitoring schema that can provide an integrated **security management** with carefully selected and analysed data through the computer network for its users. This paper presents a formal model of **dynamic monitoring for security management**. It provides the comprehensive **security management** using continuously changing **security** information, user interactions and **dynamic** activation of visual and **monitoring** objects. It enables system **security** officers to **manage** computer systems accurately, efficiently and conveniently by reflecting the state transition and the transformation of concerns and a **monitoring** level of system **security** officers immediately. This model can be used as the basis of a **monitoring** platform. (3 Refs)

Abstract: Reports on the development of networked inventory management information systems (NIMISs). These are distributed and object-oriented information systems for integral inventory management across networked organisations. The desired functionality of the systems is networked inventory management, which is the combination of integral inventory management (according to base stock control, materials requirements planning and line requirements planning) and networked organisation management (including configuration flexibility, timing flexibility and algorithm flexibility). The systems exploit distributed object technology, using both distributed systems (with local computing, heterogeneous computing and transparent computing as their principles) and object-oriented technology (characterised by object classification, attribute encapsulation and operation invocation). The system design is created with the help of the Object Modeling Technique (OMT) and consists

Search Report from Ginger D. Roberts

of an object model, a dynamic model and a functional model. For the system implementation, the Common Object Request Broker Architecture (CORBA) is applied. (37 Refs)

Abstract: This paper describes the design and function of a system being  
developed under a DARPA SBIR Phase I and II project for Adaptive Network  
and Security Management. The system is called SoSMART (System or  
Security Managers Adaptive Response Tool). The objective of our system is  
to provide an automatic, adaptive response capability that provides 24/7  
around the clock monitoring and response to system and security  
functions across a network of completing systems. To achieve this objective  
we combine an agent architecture and Case-based reasoning (CBR) with  
available system management or security tools. The agent architecture  
is used for tool integration, functional abstraction and as a medium for  
distributed reasoning. The CBR is used to define incident/response pairings  
that can recognize situations that require response and associate response  
actions with those situations. An important aspect of our system is its use  
of CBR's adaptation process to allow it to dynamically adapt it's control  
and monitoring activity as the system operates. This paper contains an  
overview of our approach, a description of important system details, a  
worked example of the systems operation and finishes with a summary. (12

**Abstract:** Internet communication is increasingly becoming an important element in daily life. Keeping this network safe from malicious elements is an urgent task for network management. To maintain the **security** level networks are generally, **monitored** for indications of usage with ill-intentions. Such indications are events which need to be collated, correlated and analyzed in **real - time** to be effective. However, on an average medium- to large-size network the number of such events are very large. This makes it practically impossible to analyze the information in **real - time** and provide the necessary **security** measures. In this paper, we propose a mechanism that keeps the number of events to be analyzed low thereby making it possible to provide ample **security** measures. We discuss a **real - time** intrusion detection system (IDS) for detecting network attacks. The system looks out for TCP ACK/RST packets, which are generally caused by network scans. The system can extract the tendency of network flows in **real - time**, based on the newly developed time-based clustering and **dynamic** access tree creation techniques. The algorithm, implemented and deployed on a medium size backbone network using RMON (remote **monitoring**) technology, successfully detected 195 intrusion attempts during a one month period. The results of the pilot deployment are discussed. In this paper, the proposal, implementation and evaluation are described. (33 Refs)

**Abstract:** The National Office of Potable Water (ONEP) is a public body in charge of the production, control and distribution of potable water throughout the Kingdom of Morocco. The ONEP Central Laboratory and a network of 46 decentralised laboratories are in charge of **monitoring** the quality of produced and distributed water, as well as pollution control of resources intended for drinking water production. In order to perform this activity, ONEP laboratories follow a variety of sampling points and type of samples (treated water, raw water, waste water, sludge from sewage works, treatment reagents, etc.) depending on the objective of control. The ONEP Central Laboratory has developed a computer based application for laboratory management (GDAL). This application was devised and adopted to

satisfy the present and future needs of the Central Laboratory. The pro-software was developed under Power Builder within a Windows environment (NT and 95). It manages more than 3500 sampling sites throughout Morocco. The system is intended for 21 users simultaneously and allows the management of analytical data of the central and decentralised laboratories. The system is developed into modules covering: (1) analysis campaign planning; (2) management of sample-taking missions; (3) samples reception; (4) analysis; (5) invoicing; (6) consultation and printing; (7) processing analytical data provided by the system. GDAL also comprises the laboratory administrative and stock management, and accounting. This application aims to: (a) enable real time user access to sample analysis information; (b) automate everyday tasks of the laboratory; (c) ensure the follow-up of all the information concerning the analysis; (d) improve the accuracy of the results by automating quality control procedures. Abstract: This article describes the implementation of mobile Internet Protocol (IP) within the Linux kernel and presents results of some experiments that quantify the effects of overheads introduced by mobile IP to the transmission of Transmission Control Protocol (TCP) segments. The mobile IP implementation is designed to support overlapping wireless cells, dynamic routing and multiple wireless interfaces. It has a socket interface that users can use to monitor the kernel stack. To reduce complexity, improve robustness and reduce bandwidth wastage, a few soft states are used. To solve a problem with gratuitous Address Resolution Protocol (ARP) in the Linux operating system used, the implementation introduces the use of vendor-specific extensions; these extensions also provide flexibility for system management and security. The experiments to quantify the transmission overheads involve File Transfer Protocol (FTP) file transfers to and from a mobile node. The results show that a file transfer can take 90% more time to complete as a result of the overheads that mobile IP introduces. In addition, mobile IP also causes a TCP connection to stall for some 2.5 s whenever a handoff event occurs. These effects on the performance of a TCP connection are observed in an internetwork setup in which both signal propagation and mobile IP registration processing delays are negligible. Hence, the impact of mobile IP on TCP performance is expected to be worse in the global Internet. (17 Refs)

Abstract: The Virtual Notebook Environment (ViNE) is a platform-independent, Web-based interface designed to support a range of scientific activities across distributed, heterogeneous computing platforms. ViNE provides scientists with a Web-based version of the common paper-based laboratory notebook, but in addition it provides support for collaboration and management of computational experiments. Collaboration is supported with the Web-based approach, which makes notebook material generally accessible and with a hierarchy of security mechanisms that screen that access. ViNE provides uniform, system-transparent access to data, tools and programs throughout the scientist's computing infrastructure. Computational experiments can be launched from ViNE using a visual specification language. The scientist is freed from concerns about inter-tool connectivity, data distribution or data management details. ViNE also provides support for dynamically linking analysis results back into the notebook content. In this paper, we present the ViNE system architecture and a case study of its use in neuropsychology research at the University of Oregon. Our case study with the Brain Electrophysiology Laboratory (EEL) addresses their need for data security and management, collaborative support and distributed analysis processes. The current version of ViNE is a prototype system being tested with this and other scientific applications. (25 Refs)

Abstract: This paper presents the multi-party multimedia middleware (M3), which offers a novel approach for simplifying **real - time** multimedia communication applications development and service provision. M3 adopts the declarative programming approach: it allows media streams and channels, QoS, **security** and charging requirements to be specified in a session description for use within M3 to invoke appropriate application, communication, QoS management, charging and **security** procedures. Applications built using the M3 middleware are only required to declare their **real - time** communication needs and are no longer required to code the creation and management of these communication requirements. The middleware handles media stream creation, **monitors** hosts and network resources for the purpose of adapting the streams' quality of service. (12 Refs)

Abstract: Progress in cognitive robotics can come either from efforts to provide physical robots with more autonomy, or from efforts to make AI techniques more generally applicable to the needs of robotic agents. We are conducting research on **dynamic** plan management, which is an instance of the latter type of effort. In this paper, we provide an overview of our research project. Plan management is the process (or set of related processes) by which a goal-directed agent coordinates, up dates, and **monitors** its plans in response to ongoing changes in its environment. We discuss the main challenges in automating plan management, and then illustrate our approach by focusing on one plan **management** task: evaluating **options** for action in the context of existing plans. We also briefly describe the Plan Management Agent (PMA), a system we are building as a testbed for our plan management theories. Although PMA is not a robotic system, we are interested in also applying **dynamic** plan management techniques to mobile robots. (21 Refs)

Abstract: Stockbot is a software agent designed for the task of monitoring an electronic stock market in order to execute investor purchase or sale orders. Stockbot represents a tool for managing the dynamical complexity of electronic stock markets by establishing a virtual portfolio manager. Its main goal is to exhibit a behaviour which is a timely, continuous, dynamical response to changes in the market situations in accordance to the user profile and goals. The software agent maintains and dynamically updates a user model which records histories of previous user orders, patterns of user observed behaviour, and user preferences and goals. The software architecture integrates conventional and knowledge-based software technologies such as conditional and iterative planning, continuous conditions monitoring, robust failure management, inter-agent communication primitives and events networks. A dynamical query language is used to describe stockbot behaviour. (29 Refs)

Abstract: This presentation describes the RETSINA (Reusable Task Structure Based Intelligent Network Agents) framework, explicates the unifying organizational and architectural ideas and demonstrates their applicability to various dynamic domains (e.g. financial portfolio management, distributed calendar scheduling, satellite visibility tracking). The architecture of a single agent as well as the coordination

Search Report from Ginger D. Roberts

strategies that the agents use are presented in some detail. RETSINA is a flexible framework that enables agents to dynamically form agent teams "on-demand" to solve a problem, taking into consideration and adapting to the user, task and situation. For example, RETSINA agents monitor sources of stock information, financial news, historical data, EDGAR data (EDGAR is the database that keeps annual and quarterly company earnings reports) and notify the user of relevant changes. In addition, the agents collaborate to integrate data from these different sources. Moreover, they provide advice to the user regarding prospective stocks and act on a user's behalf performing stock buying and selling transactions. The RETSINA group believes that the next generation of agent technology will heavily rely on multiple adaptive coordinating agents that support users not only in gathering information but also in making decisions, thus providing advantages far beyond conventional agent technology. This paper presents the lessons learned in a wide variety of domains. (4 Refs)

Abstract: The mobile agents technology is suited to express the management of distributed systems, by overcoming the limits of the traditional manager/agent model. In addition, mobile agents can easily integrate with the Internet scenario and the Web. The paper describes the MAMAS (Mobile Agents for Management Applications and Systems) tool implemented with a mobile agent technology. MAMAS has been developed with the goal of designing monitoring tools for the whole system and of introducing automatically correction actions. In addition one operator can decide to dynamic modify the predefined management strategies. MAMAS has been implemented in a mobile agent framework, capable of modelling the Internet world composed of interconnected networks, each of them with its peculiar policies (for administrative, management and security purposes). MAMAS and the supporting framework has been implemented in Java.

Abstract: This paper describes a new advanced **security monitoring** system for energy **management** system (EMS). In this paper, the authors propose a new concept called **successional static monitoring**. The **successional static security monitoring** system evaluates each snapshot which has different network state. It has been difficult for **dynamic security monitoring** to simulate all the restoration process, because the actual restoration process includes changes of network configuration and changes of power supply, and all the restoration process cannot be simulated successively. In order to realize this new concept, this system includes two simulators. One is a network simulator that calculates load flow and frequency **dynamic** characteristic of each snapshot. The other is a dispatch center simulator that decides the various commands to control generators and searches for the restoration routes when a blackout occurs. It includes an intelligent dispatcher model that emulates the various actions of human operators. Also this system calculates the running cost of generation that satisfies trade-off for various **security** indices. With these simulators, this system evaluates the restoration time and estimates restorable loads after contingent faults through the restoration process.

Abstract: Evolution of the World Wide Web, its heterogeneous nature and the rapid rate at which information is made accessible through the Web

presents many challenges to the Internet community. Distributed object computing and Internet programming play a significant role in this evolutionary process. The advantage of distributed object computing is achieved by the object-oriented distributed systems which provide a global object name-space and support remote method invocation. They express computation as a set of autonomous communicating entities (objects). Object migration, management of its state, security and portability are some of the challenges faced by object-oriented distributed systems. Java is an object-oriented distributed, and dynamic language designed to support applications on networks. In its current state, Java does not support transparency in distributed execution. We propose a method for remote object creation and method invocation in Java. Our objective is to provide a proof of concept for facilitating distributed execution of Java applications using remote objects. This extension provides a partial solution for the support of distributed Java applications to be executed transparently. (6 Refs)

Abstract: The economic impact of black-outs on power systems worldwide amounts to thousands of millions of French Francs, as shown by examples in France in 1987 and in the United States in 1996. The management of power system security at EDF is based upon: a hierarchical operation; studies, decisions and planning before real - time operation to minimize the cost; monitoring and simulation tools to alert operators as soon as possible; and operation rules. Some new tools developed by EDF are presented in this paper, as are the consequences of the European directive. (0 Refs)

Abstract: A versatile control system, which uses standard commercial software and hardware has been developed and applied to control oxide (and carbide) MOCVD and CVD systems. The control system is implemented within a personal computer platform. The system operates in the **real time** Microsoft Windows<sup>TM</sup> environment utilizing the full advantage of the sophisticated graphical user interfaces, **dynamic** data exchange, networking, and multitasking capabilities. We have used two different sets of commercial software to control and **monitor** system hardware. The first software set is INTOUCH<sup>TM</sup>, a Man-Machine interface software from WONDERWARE<sup>TM</sup> in conjunction with Microsoft Excel<sup>TM</sup> and I/O interface software. The second software set is LABVIEW<sup>TM</sup>, which is primarily a data acquisition control system from National Instruments, combined with Visual Basic<sup>TM</sup>. Both systems include a friendly interactive **real - time** windows-based user interface, an advanced process entry and recording spread sheet interface, alarm and **security management** systems, data display and recording, maintenance routines, and complete networking and remote operation capabilities. In addition, the configurations provide a flexible hardware interface that can directly interface to I/O cards in the PC's bus, as well as to most industrial Programmable Logic Controllers, various types of process controllers, I/O devices and other forms of hardware. Most importantly, the system can interface with any in-situ process **monitor** or higher level intelligent process control systems in order to optimize the process. Modules may be activated or deactivated as needed (even as part of the process). These systems have been used for home-built systems, as well as to retrofit a modified Spire SPI-MOCVD<sup>TM</sup> 500XT system. General process interaction and results will be discussed. (9 Refs)

Abstract: SIRTOM (Surface Irrigation **Real - Time** Optimization Model) was developed as a **real - time** DSS capable of improving surface irrigation performance on a **real - time** basis. It was built on kinematic wave simulation and nonlinear optimization models to derive soil-water infiltration from **real - time** advance measurement data. It incorporates computational analyses to evaluate irrigation system performance, and can

handle two different inflow management options : constant inflow during the entire irrigation event, and an innovative variable inflow strategy that corresponds to a feedback control logic. SIRTOM predicts the irrigation event performance and lets the user go through the variable inflow options to investigate the effects of inflow adjustments on the hydraulic conditions of the actual irrigation event, allowing for possible improvements in system performance. With the variable inflow management option, SIRTOM predicts the portion of the modified advance based on soil infiltration characteristics derived from fitting the early stages of the original advance phase. Also, the original advance is predicted up to the end of the field. By predicting the performance for these hydraulic conditions, the software makes information about the outcome of the irrigation available early enough for an operational decision to maintain the original advance or to establish better hydraulic conditions. SIRTOM was tested on different field conditions, exhibiting a satisfactory performance as a DSS. It is being used for monitoring seasonal surface irrigation performance in the Brazilian northeast irrigation districts. (10 Refs)

Abstract: Trans Power New Zealand Ltd. is the owner and operator of the New Zealand high voltage transmission grid, providing a despatch service to the nation for managing electric energy production from generating stations owned and operated by the Electricity corporation of New Zealand (ECNZ) and independent power producers. During 1988/89, Trans Power undertook a major review of existing control facilities for monitoring and controlling the high voltage transmission grid, and for supporting the generation despatch role. The review revealed major shortcomings with SCADA control and with the communication systems, both to support existing grid operating activities and to cater for the planned expansion of the HVDC link interconnecting the country's AC island systems. This paper outlines the development leading to the complete upgrade of the communication and SCADA control systems in the North Island and South Island. The North Island control centre has been relocated, and will be supported by a new Energy Management System (EMS) and a new communication system. In the South Island, existing SCADA hardware and software is being replaced. Each island control centre will have the ability to back up the other control centre in the event of a major control centre failure. The New Zealand power system has a number of features that affect the operational performance and security of the transmission grid. These include heavy reliance on spinning reserve, and steady-state and dynamic constraints on transmission transfer capability. In addition, scheduling of the HVDC link and coordination of the hydro and thermal generating resources present operating challenges. This paper lists the special software applications being developed as part of the nationwide EMS to monitor security, manage grid transfers, and achieve optimal despatch of the generation resources. This paper also describes the communication network and remote terminal units (RTUs) provided to support these applications and points out some of the issues considered significant in embarking on a project of this magnitude. Treatment: Practical (P)

Abstract: Complex data management systems are causing many managers to consolidate equipment and facilities without radically altering the look and feel of their networks. Often, both leased line and dial services exist within the same network, so a management system must be able to integrate the monitoring , control and maintenance functions of dial and leased line facilities in a cohesive, user-friendly environment. Octocom Systems Inc. have announced a new version of their OSI 821 network management system which does just that. Version 4.7 of OSI 821 combines the real - time monitoring , control and access security features of previous versions with enhanced configuration, security and leased line management capabilities. Language: English Document Type: Conference Paper (PA)

Treatment: General, Review (G)

Abstract: A discussion is presented of the issues surrounding network management functions for a proposed high-performance, highly fault-tolerant, distributed, real - time system architecture. Although many of the traditional concepts of network management such as fault, configuration, performance, accounting, **security**, planning, and application **management** certainly apply to such systems, there are additional considerations. As discussed these include technical issues such as common-mode failures and the network manager's inherent reliability, as well as development of testing and evaluation criteria for the network manager itself. Finally, modeling, simulation, and **monitoring** are important aspects to network manager assessment. (0 Refs)

Treatment: Practical (P)

Abstract: All large modern manufacturing plants today possess numerous microprocessors and CPUs utilized for **monitoring** and control of the various pieces of production equipment, and factory floor data collection. In order to allow for the addition of future equipment or modification of existing production equipment, without the complete disruption of the existing cable plant, is economically feasible cost effective to utilize facility-wide local area networks and associated communication facilities. Any local area network can be defined by the ISO/OSI model which has seven layers. In order to allow a handshake and proper communication between unlike processors and/or terminals connected thereto, it is necessary that the upper six layers of the ISO/OSI model be clearly defined, such as by MAP or TOP. Neither MAP or TOP define the lower layer protocols required for mixed voice and data applications. It is a function of the paper to deal with the latter, which includes other **real - time** systems, such as fire alarm, **security**, and energy **management** systems. (0 Refs)

**Title: Ventilator risk management using a programmed monitor**

Author(s): Silvern, D.A.; Gupte, P.M.

Author Affiliation: Div. of Biomed. Eng. Services, Westchester County Med. Center, Valhalla, NY, USA

Journal: Journal of Clinical Engineering vol.14, no.3 p.217-24

Publication Date: May-June 1989 Country of Publication: USA

CODEN: JCEND7 ISSN: 0363-8855

Language: English Document Type: Journal Paper (JP)

Treatment: Practical (P)

Abstract: A computer program was written to improve quality control and **risk management** of patients on ventilators. The software was designed to run on the new-generation Spacelabs PC **Monitor** interfaced to the Puritan-Bennett 7200a ventilator. Before the program allows connection of the ventilator to a patient, the ventilator is polled for initial hardware status, alarm statuses and alarm limit settings. If there are no hardware failures, alarm violations, or improperly set alarm limits, the program prompts the clinician to connect the ventilator to the patient. Polling is done periodically after patient ventilation begins, and patient data, alarm conditions, or changes to the ventilator settings are automatically written to disk. In addition, **real - time** data can be displayed at any time during the ventilation session by using a set of touch-screen **options**. After the ventilation session is complete, the clinician can print the final report in hard copy or to disk. (7 Refs)

Abstract: Software Sciences, a wholly-owned subsidiary of UK-based Thorn EMI, has changed the name of its New York-based subsidiary, Financial Trading Systems (FTS), to Software Sciences. The name change reflects FTS's new identity since Software Sciences acquired it in July 1988 to gain a foothold in the US and to complement businesses in the London, Frankfurt, Amsterdam and Tokyo financial markets. The Software Sciences products being adapted for the North American market, FX-COLT and VALUTA-IDS, are **real - time** front office trading support information systems for foreign exchange. FX-COLT is a foreign exchange and **money market** trading support information system that runs on Stratus hardware and provides traders and managers with **real - time** P & L, position keeping, exposure, reports, cashflow, maturity schedules and **risk management**. VALUTA-IDS, which runs on Tandem hardware, interfaces with intelligent workstations, calculates P & L, keeps positions, **monitors** exposure, distributes market data, provides powerful decision support calculation tools and processes and links front office trades to back-office settlement. Treatment: Practical (P)

Abstract: The Meridian Data Networking System (DNS) from Northern Telecom is a virtually **transparent** communications network that could open closed information **management** doors at **financial** firms and ease the process of upgrading to better systems. DNS can support a variety of host and terminal devices, including IBM's SNA, personal computers and ASCII terminals. In addition, it supports major access and transport **options**, such as X.25, 802.3 and 802.5 data delivery protocols. For the financial professional, this high-tech rebuilding of the Tower of Babel allows him or her to coordinate multiple applications into a coherent, manageable network. It also offers **real - time** command control and communication not just for the transport mechanism but for the entire network, including the computers. (0 Refs)

**Title: Ore depot: a local network manages it**

Journal: Mesures vol.52, no.5 p.53, 55

Publication Date: 6 April 1987 Country of Publication: France

CODEN: MSRSET ISSN: 0755-219X

Language: French Document Type: Journal Paper (JP)

Treatment: Practical (P)

Abstract: Describes the system and network of industrial programmable controllers involved in automation of the Usinor-Dunkerque depot which handles and stores 32500 tonnes of ore per day over an area of 4 km<sup>2</sup>. The distributed architecture incorporates a Factor network of 32-bit **real** - time Classic minicomputers at three levels with Modcomp Maxpac modular supervisory software which also **monitors** the functions of the machinery, maintains a permanent distribution inventory and manages priorities and safety; it will be extended to raw-material **management**, **stock** control and daily storage planning. Its critical response time, defined by Clemessy-Productique drawing up the specification in collaboration with Usinor, is quoted as less than 1 second for any emergency or unprogrammed event. Abstract: Two graduate courses in the area of **real - time** control and operation of power systems are reported. The objective of the courses is to study **real - time** control functions as performed by modern energy control centers. The main topics addressed are: (1) data acquisition and estimation, (2) energy management /automatic generation control, and (3) **security monitoring** and control. A unique feature of the courses is the use of interactive computer programs. These programs assist in studying in depth and understanding the concepts underlying the **real - time** operation of power systems. Course contents and the utilization of computer programs to enhance student comprehension of the concepts involved are dealt with. Typical homework assignments are described. The courses are presently offered at Georgia Tech. (5 Refs)

**Exodus plans to expand into managed services**

Clancy, Heather

Computer Reseller News, November 20, 2000, n921 p126, 1 Page(s)

ISSN: 0893-8377

Company Name: Exodus Communications

Reports that Exodus Communications of Santa Clara, CA, declared its intention to expand beyond Web site collocation into managed Web hosting

Search Report from Ginger D. Roberts

and Web application management services. Says that Exodus is building space in three data centers to handle the first wave of its managed services. Mentions that it plans to go live with a broader content distribution service dubbed MirrorImage. Explains that Exodus offers firewall management and other security measures, plus performance monitoring and storage services. Indicates that Exodus expects to meet revenue projections of \$270 million to \$280 million for its fourth quarter, with gross margins of 31 to 33 percent. Notes that Exodus is exploring acquisitions in Europe and Asia as an avenue for Exodus' services expansion. Includes a photo. (MEM)

A hot market for corpses - here comes the ghouls  
Taylor, Wendy; Jerome, Marty  
Ziff-Davis Smart Business for the New Economy , November 1, 2000 , v13  
n11 p50-52, 2 Page(s)  
ISSN: 1528-4034  
Company Name: Onvia.com  
NET CURRENCY column discusses the sudden interest in Internet cadavers. Observes that there is more value in dead and near-dead dot.coms than in the live-wire kind that make the NASDAQ kick and scream. Relates that the smart money finds them by watching the burn rate, the speed at which a company roars through investors' cash without turning a profit, and that is where fortunes lie. Notes that a lot of Internet companies are founded on good ideas but saddled with bad management and inflated stock prices, and once investors lose on these speculative shows, ghouls step in. Says that Onvia.com scooped up home-improvement company Hardware.com for roughly \$4.5 million. Adds that a lot of failing dot-coms are happy to become ghoul bait, as more than 100 companies reaching the end of their burn rate have approached Onvia.com hoping to be acquired. (KMD)

Yerxa, Gregory  
Network Computing , July 15, 1998 , v9 n13 p83, 1 Page(s)

ISSN: 1046-4468  
Company Name: Foundry Networks  
URL: <http://www.foundrynet.com>  
Product Name: Foundry Networks ServerIron 3.05  
Presents a favorable review of ServerIron 3.05 (\$6,295), a hardware-based load balancer for Web servers from Foundry Networks (888, 408). Features eight to sixteen ports for load-balancing and redundancy. Includes options for nonserial failover and multiple configuration interfaces, and support for Gigabit Ethernet, Ethernet, and Fast Ethernet. Also mentions its impressive performance and low price. Calls it easy to manage ; however, complains that its configuration options are lacking and that there is no realtime monitoring . Also complains that features such as failover status, are difficult to access, and that the individ load balancers must be configured individually. Concludes th is a high performance, although basic, load balancing solution. Gives it a score of 2.78 out of five (B). Includes one photo. (kgh)

**Branch-office ISDN: five difficult pieces -- When remote LAN managers want to link branch offices via ISDN, it's up to corporate networkers to keep them out of trouble**

Jones, Bob  
Data Communications , February 1, 1996 , v25 n2 p131-138, 5 Page(s)  
ISSN: 0363-6399  
Discusses support issues associated with the trend toward distributed internetworking. Says decentralized internetworking can facilitate more dynamic and efficient communications among remote branch offices, but poses support challenges for enterprise network management teams because of the limited technical resources of branch office LAN administrators. Notes that support issues are typically centered around remote access server configuration, security management , link utilization, bandwidth allocation, and remote monitoring and management. Also says careful planning and an understanding of these support issues will enable easier and better management of small remote access servers and sites. Includes five drawings and a diagram. (dpm)

**Unicenter disappoints**  
Hoffman, Thomas  
Computerworld , April 4, 1994 , v28 n14 p1, 12, 2 Page(s)  
ISSN: 0010-4841  
Company Name: Computer Associates International  
Product Name: CA-Unicenter  
Discusses Computer Associates International's CA-Unicenter (\$7,000 and up), systems management software designed to monitor HP's Unix environment. Says that a number of analysts and users were disappointed in the software's performance, stating that it did not live up to the vendor's claims for mainframe-class systems management. Explains that complaints ranged from the proprietary nature of the software, which prohibited the addition of other vendors' modules, to weaknesses in the help desk management area, plus stiff pricing. Indicates that the program gets a positive rating for managing a very large data center. States that some facets of the program are applauded by users, including strength security , tape management , and workload management . Says vendor officials acknowledge that Unicenter may not meet across-the-board capabilities promised, but upgrades are planned. Includes one table. (cld)

Willams, Dennis  
LAN Times , October 26, 1992 , v9 n20 p81, 1 Page(s)  
ISSN: 1040-5917  
Company Name: Penril DataComm Networks  
Product Name: Series 2000  
Presents a very favorable review of the Series 2000 (\$10000), a modular five-slot hub from Penril DataComm Networks of Gaithersburg, MD (800, 301). Features of each module include a RISC processor as well as support for comprehensive filtering, Simple Network Management Protocol (SNMP), network security and segmentation; 10Base-T modules concentrate up to 24 nodes while a WAN module handles routing/bridging functions between remote locations. Says that Series 2000 supports multiprotocol routing and concurrent transparent bridging as well as extensive filtering options for controlling and tailoring network traffic patterns; its DOS-based Device Management Utility (DMU) configures, troubleshoots and manages the concentrator while providing real - time statistics, alarms, remote management access, multi-level network management and diagnostics

capabilities. (PAM)

**Network management and security**

Jander, Mary

Data Communications , December 1, 1991 , v20 n17 p99-103, 5 Page(s)

ISSN: 0363-6399

Company Name: SynOptics Communications; Concord Communications; Remedy  
; Cylink  
Product Name: Hub Management Software; Trakker; Action Request System;  
Cylink Model 8100FT1 Network Integrator

The Network Management and Security section of a year-end review of data communications products presents favorable reviews of the following products: Hub Management Software (\$NA), net management applications for DOS, Unix, and OS/2, from SynOptics Communications of Santa Clara, CA; Trakker (\$30,000), a LAN monitor that works in **real time** from Concord Communications of Marlborough, MA; Action Request System (\$6,500), the first network management application that runs on several popular network management systems, from Remedy of Sunnyvale, CA; and the Model 8100 FT1 Network Integrator (\$4,000 to \$15,000), a channel/data service unit encryption scheme from Cylink of Sunnyvale, CA. Includes three diagrams.

**Symbol Technologies scores at World Cup soccer games**  
Industrial Engineering v. 26 (July '94) p. 26-7  
DOCUMENT TYPE: Feature Article ISSN: 0019-8234

ABSTRACT: Data systems from Symbol are to be used in **security monitoring** at the 1994 World Cup soccer games. Through wireless data communication and collection technology, Symbol will support the access control and logistics management of the games. With the robust Symbol products providing **real - time** access to actionable information, World Cup personnel will be capable of **managing security** for 50,000 people and controlling an inventory of 4,000 pieces of equipment.

**Security system eases EMS transition**  
Electrical World v. 207 (Apr. '93) p. 46+  
DOCUMENT TYPE: Feature Article ISSN: 0013-4457

ABSTRACT: Part of a special report profiling transmission and distribution projects. When the Pennsylvania/New Jersey/Maryland (PJM) Interconnection decided to build a new transmission **security** system (TSS), its existing energy **management** system (EMS), lacking such advanced capabilities as a TSS module, could not support the TSS's state-of-the-art features. PJM, which comprises 11 electric utilities that operate free-flowing ties as a single control area, plans to install an all new system eventually, but it

Search Report from Ginger D. Roberts

still needed an advanced TSS to help satisfy growing demands on its control area. ABB Systems Control's solution was a TSS that runs on top of the old EMS in a concept similar to that of commercial software shells that create a user-friendly interface. The system includes a full complement of power-network applications software that enables PJM dispatchers to monitor the state of the system and perform real - time pre- and post-contingency analysis of voltage/reactive problems.

Bank Directors and Limiting Interest Rate Risk
Myers, Cliff
Banking Management, v67, n2, p51, Feb 1991 DOCUMENT TYPE: Periodical
LANGUAGE: English RECORD TYPE: Abstract

ABSTRACT: For the directors of all banks, national and state, the Options Clearing Corp. (OCC) Advisory AL 90-1 from the Comptroller of the Currency is extremely important. It provides an excellent indicator to all banks as to what to expect from their regulators regarding interest

Search Report from Ginger D. Roberts

rate risk management. In addressing interest rate risk, bank directors should keep several considerations in mind, including: 1...

...The safe, sound, and prudent management and limitation of interest rate risk must be a **dynamic** and continuous process. A board policy on interest rate risk should provide the foundation for quantifying, analyzing, and **monitoring** the risks. It should address the sources of those exposures as well as compliance with...

...and charter focus on tools and inputs for investment valuation and management, asset allocation and **portfolio management**. Among these thousands of candidates were nearly 600 Certified Financial Planner designees. Why would...

...study for each level750 in totalto take this exam, traditionally taken by institutional analysts and **mutual fund** managers and administered by the Association for Investment Management and Research? What is the appeal

...charter tended to be buy-side institutional investment professionals who managed large retirement assets or **mutual funds**," says Tom Bowman, chief executive officer of the AIMR, whose operations are based in Charlottesville...the goals and risk tolerance of these clientsputting a portfolio of investments together." Investments and **portfolio management** are where the CFA designation meshes with the CFP analysis, he says.

Sant, who prepares...

...to investment management, institutional perspective and how taxes impact on trusts and endowment management of **mutual funds** . "You're looking more at diversification, global investing, economics, quantitative methods and fixed-income **securities** . You need to know a lot of different areas to be able to manage investments...

...asset allocation, but with a different slant and emphasis. While CFA preparation honed in on **security analysis**, cash-flow accounting and **portfolio - management** issues, he found CFP emphasis on the aspect of client communication and information gathering especially...a money manager for Merrill Lynch or Goldman Sachs' or I want to run a **mutual fund** , ' clearly the CFA is the union card.' If someone wants to work with individuals in...

...having effected positive changes in their respective areas. In the sense of valuations, analysis and **portfolio management** , he feels the CFA designation has pushed the investment-management industry to become much more...investment and estate planning on a fee-only basis. "Most CFPs who manage money use **mutual funds** , " she says, "primarily transferring the day-to-day investment decisions to another manager, whereas I primarily work on directly owned **stocks** and **bonds** ." Rather than focusing on quarter-to-quarter fluctuations or keeping up with the Standard & Poor...

...a buy-and-hold philosophy, picking up all the major segments and some lower volatility **stocks** to make it easier to **live** with in the long term.

Considering the work done by CFAs at all levels of...this day of mass media, people know about analysts," he adds. "When analysts recommend a **stock** , people buy. They move markets." Because the CFA's target market, for the most part...

...deal with individuals on a day-to-day basis and deal with lawyers, tax issues, **mutual funds** and accountants. This service-delivery process puts the CFA closer to the wholesale side and CFPs on the retail side," he says.

Bowman confirms that AIMR is **watching** this situationparticularly the change in demographics bringing CFAs closer to the investment public, which necessitates...

AB- <NV> NOVELTY - Apparatus for securing passive resources including a file, a directory, a memory and a port and active resources including a process and a thread in an system when the system is on-line or off-line with networks comprises: a provision unit for providing the resources and **security** conditions of the resources; a selection unit, in response to a user's request. |

AB- <BASIC> DETAILED DESCRIPTION - Also for selecting resources to be secured and **security** conditions for the selected resources; a combination unit for combining the selected resources and the selected **security** conditions; a monitoring unit for monitoring dynamically the selected resources based on the selected **security** conditions; and an analysis unit for analysing the monitoring result to manage record data concerning **security** -needed situations that include unauthorized infringement and access to the resources

INDEPENDENT CLAIMS are also included for the following: method for protecting passive resources; computer system

USE - For on-line or off-line computer systems.

ADVANTAGE - Protects resources of an intellectual property and information system base on the active agent. And, the present invention not only maintains and manages an elementary record such as number of times infringement, criterion of infringement, scope of infringement, location of infringement, time of infringement, and contents of infringement but also providing a technique for making detecting infringement and maintaining the record of infringement possible when a system is on-line or off-line.

AB- <PN> WO 200078057 A1|  
AB- <NV> NOVELTY - Processor connected to memory and communicating with  
external devices comprises a local primary focal node (PFN) and has  
programmable hardware and modular software or firmware called as  
trusted remote activity controller (TRAC). The software enables  
automated and remote control accountability for communication equipment  
as determined by industry or Government standard protocols and for  
interfacing activity controllers of control equipment.|  
AB- <BASIC> DETAILED DESCRIPTION - The management system comprises sensory  
device for monitoring and reporting on data comprising command  
function results of peripheral devices and equipment. The memory is  
connected to sensory device and arranged in the vehicle or equipment  
for storing interface protocols for interfacing and communicating with  
peripheral devices that perform automated and remote control function.

The external device connected to processor comprises electrical activating accessory, a peripheral device controlling automated remote control function using electricity, compressed air, gases, vacuum, hydraulic and fluid pressure, motors, mechanical or silicon relay, pistons, cylinders, pumps, valves, linkage levers, shifter forks, paws, ratchets, couplers, gearing or power transfer mechanism, cases, brake pads, disk assemblies, drums, clutches or interlocking drive mechanism, spined hub collars or shafts. The external device is connected to process through a two-way communication system comprising a **security** device or routine to conduct signal with a **security** protocol.

INDEPENDENT CLAIMS are also included for the following:

- (a) Portable primary focal node (PFN) tracking device;
- (b) Connectable system software (TRAC);
- (c) Local PFN with trusted remote activity controller (TRAC);
- (d) TRAC software record keeping of device serial numbers and personal indication numbers for its authorization and authentication program;
- (e) Electrical seal system for detecting tampering and for providing water resistant seal protection;
- (f) Universal communication interface for routing function;
- (g) Memory for data processed using TRAC system;
- (h) Remote control of actuators using PFN and processor;
- (i) Accountability for activity controls confirmed by feedback sensor;
- (j) Application specific sensing and supply data to **monitoring** or management system;
- (k) Internet system for interactive highway;
- (l) Interfacing or uplinking of remote **monitor** or management system;
- (m) Switching;
- (n) Machine messaging networks and computer networks;
- (o) National registry to track and identify equipment and components;
- (p) Spider eyes program and multitasking law enforcement tool to shutdown vehicle;
- (q) Automated and remote controlled communication routing of wireless or land line;
- (r) TRAC/FACT programming and hardware system for interconnecting internet

USE - Vehicle or equipment system used for management remote controlling robotic function to activate and control vehicle operation, remotely billing for use of vehicle, remotely operating machine, evaluating and diagnosing computer or processor malfunctions, remotely ordering materials and service personal to perform service and repairs, remote performing repairs electronically and remotely shutting down equipment, to restrict unauthorized use of equipment, to record and preserve data in acceptable legal manner, **monitoring** equipment for health and safety conditions affecting public such as reckless driving, driver impairment, pollution, vehicle unsafeness, recording and reporting **monitoring** gateway for billing user for use of highway, for accident investigation and machine accidents, recording audio and video of capture criminals incidents by activating and unattended vehicle system to report criminal events through remote control, recording audio and video of weather and traffic conditions, etc.

ADVANTAGE - Unauthorized access of vehicles and equipment can be prevented from remote place.

DESCRIPTION OF DRAWING(S) - The figure shows the PFN/TRAC system of four main areas of involvement comprising control **security** technology, mobile **management**, home **management** and commercial **management**.

AB- <BASIC> WO 9806214 A  
The apparatus has a device for issuing an authorisation request for a transaction, which is a point-of-sale, credit card or other authorisation device. There is an authorisation request processor and a communication device such as a telephone signal receiver, beeper, pager, telephone, two-way pager, computer, or television.  
The authorisation request is processed in conjunction with predefined criteria and the authorisation is progressed by issuing the authorisation request for the transaction, notifying the authorised individual of the request and processing the response.  
USE - For wireless communication for authorisation, notification of credit, charge, smart or debit card usage, and managing savings accounts and banking accounts and cellular telephone usage.  
ADVANTAGE - Provides for real - time notification of cellular or mobile telephone usage, enabling owner monitoring. Advises user if telephone is lost or stolen, allows cancellation of telephone usage, enables connection via Internet to operate with home or office computer. Can be programmed to telephone cardholder, is menu-driven, enables authorisation, notification and security in financial transactions involving credit, charge, debit and smart cards. Allows user to increase or reduce credit limits. Overcomes problems associated with cloning of cellular telephones.

    A CPU collects and stores **securities** market data on disc and distributes, as relevant, to internally linked client's storage where portfolio information is also located. Buy and sell orders are created at each location by a computer algorithm which analyses the data w.r.t. the portfolio.  
    The CPU is linked to external automated brokers to which orders are sent only if not executed internally. Order information may be viewed, sorted or altered by the clients in **real time**.  
    ADVANTAGE - Manages large portfolios more effectively. (20pp  
Dwg.No.9/9|  
AB- <US> US 5101353 A  
    The system uses data processing equipment to place buy and sell orders on **securities** markets and with automated brokers to execute trade directly between users of the system and external markets. Holders of such large, diversified portfolios have usually been long-term investors. The system allows active market participation by such investors whereby they provide added liquidity and depth to the **securities** markets while overcoming problems caused by trader identification and the inability to enter, change or execute orders in a **real time** environment. The system monitors and analyses a variety of factors which effect trading decisions in a vast number of **securities**. Such factors include other **security** trades, price and size quotations and financial ratios for particular **securities**. This information is further analysed in relationship to each investor portfolio using the system to determine what transactions might benefit the portfolio by seeking to provide an incremental return while accommodating the basic **portfolio** objectives. USE/ADVANTAGE - For managing one or more large investor portfolios containing both cash and numerous, diversified **securities** in a **real time** environment provides added liquidity to the **securities** markets while maintaining predetermined **portfolio** objectives for each **portfolio**|

AB- <NV> NOVELTY - A processing system routes information between investors and stock market, and generates a transaction criterion to agreed originating and fulfilling side brokers, based on electronic transaction with output by investor. The transaction criteria accepted by the market is received and displayed in investor terminal. An indication about acceptance of displayed transaction criteria is input to investor terminal. |

AB- <BASIC> DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(a) Computer system;

(b) Order management process software

USE - In e.g. broker-to-broker system used in financial industries to manage orders for transaction on exchange e.g. for trading goods, services, instrument, commodity.

ADVANTAGE - Increases efficiency of cross border transactions, with reduced cost and increased transparency, since local specific conversion and settlement issues are automatically handled, this also increases volume and liquidity of international securities transaction.

AB- <NV> NOVELTY - Method consists in accessing investment tools,  
communicating data among them using a common central interface,  
performing real-time electronic crossing transactions by users  
indicating willingness to match offsetting orders and real-time  
monitoring of the tools functions, with an intermediate function value  
available for review during a pending transaction. A report is  
presented with tools data in a uniform format. The tools are portfolio  
analytic and accounting tools, risk management tools, research  
data tools etc. and the functions are lending securities .|  
AB- <BASIC> DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for  
the following:  
(1) A system for managing investment portfolios.  
(2) An investment portfolio management computer program.  
USE - Method is for managing an investment portfolio .  
ADVANTAGE - Method facilitates user selection of alternate  
investment tools.  
DESCRIPTION OF DRAWING(S) - The figure shows a system for  
integrating investment tools illustrating a hub and spoke design.

AB- <NV> NOVELTY - Portfolio of assets and liabilities for each of individual or smaller investors is created based on trading data received from the personal computer. The trading of the assets and liabilities in portfolios is executed to create portfolio or modify the portfolio of the individual or smaller investors. |  
AB- <BASIC> DETAILED DESCRIPTION - The processor is arranged in communication with individual or smaller investor personal computers via communication links. The investor identification information and investor preferences and trading data are received from each personal computer. The received trading data is stored in memory (4) connected to the processor. INDEPENDENT CLAIMS are also included for the following:  
(a) Portfolio of securities or other assets or liabilities creating and managing method on cost effective basis;  
(b) computer program product for creating and managing portfolio of securities or other assets  
USE - For creating and managing of portfolio of securities, assets or liabilities for use by brokerage company, new financial investing system over Internet, on cost effective basis. Also used for any security, including foreign or domestic equities, options, warrants, bonds, notes, limited partnership interests, private placement securities. Also used for fungible commodities, futures, bank loan syndication interests, hotel reservation, golf tee times, country club membership, antiques, airline reservations, mortgages.  
ADVANTAGE - Control over the tax effects of purchases or sales of securities included in portfolio prevents investor from being presented with unwanted taxable gain due to discretionary sales transaction of fund managers. All the information necessary to monitor and manage tax effects and capability to sell or buy the individual

Search Report from Ginger D. Roberts

**securities** in his portfolio to obtain desired tax benefits. All shareholder rights with respect to each security in portfolio to investor and full ownership and control over all investment, voting and other decision, regarding such **securities**. Reduces costs since the system aggregates order flow limits number of actual trades that need to be made external to the system directs investors, to specified **securities** to further concentrate the order flow and automates the input process. Enables investor to acquire fractional and small numbers of shares thereby permits cost effective creation and maintenance of smaller diversified portfolios thereby facilitates to create and own a diversified portfolio of **securities**.

DESCRIPTION OF DRAWING(S) - The figure depicts the block diagram of **portfolio** creating and **managing** system.

A new benchmark for dynamic currency management  
Lequeux, Pierre  
Global Investor n106 PP: 26-28 Oct 1997  
ISSN: 0951-3604 JRNL CODE: GLI  
WORD COUNT: 2007

...ABSTRACT: the true yield of the currency market because they are either proprietary and not fully transparent or are passive index and not relevant to the measurement of dynamic portfolio management. The dynamic currency benchmark FXDX was developed to answer these issues. The originality of the FXDX resides in its transparency and its high degree of correlation with the average performance of active currency managers. Unlike other assets such as stocks and bonds, currencies require active management to yield significant returns. The FXDX may well provide the answer to the problem of monitoring trading styles for the currency sector. ....

Using Web-Based Risk Technology to Appease the Regulators. (financial services) (Industry Trend or Event)

Helland, Erik

Wall Street & Technology, v16, n10, p55(1)

Oct, 1998

ISSN: 1060-989X      LANGUAGE: English      RECORD TYPE: Fulltext  
WORD COUNT: 907      LINE COUNT: 00079

TEXT:

A main goal for the systems is **real - time** reports, meaning quicker analytics. Regulators are turning up the heat on risk managers, forcing them to grant greater access to their inner management policies for federal **watchdogs**, investors and board members. To appease them, financial institutions are investing in Web-based technology, typically in a form that provides **real - time** analytics and report distribution. A number of financial institutions including Parker Global Strategies, Societe Generale

...

...based risk technology system in the past several months. "Many financial organizations have implemented firmwide **risk management** systems in response to regulatory reporting pressures and use their systems simply to generate the..."

...says Octavio Marenzi, research director with Meridien Research, reacting to the new capability. "However, using **risk** analytics to **manage** the firm's portfolio effectively requires giving traders, controllers and managers in all the firm's trading locations access to the **risk management** systems. Intranets will act as a facilitator in this process, and will allow those firms..."

...their capital more effectively." For many institutions, the central task is to issue reports in **real time**, but that requires speeding up the analytics process. Parker Global Strategies in Stamford, Conn. implemented

...

...analytics process. As a result, the firm can distribute risk reports to institutional clients in **real time**, MakeVC processes the calculations faster than other products because it does not use a spreadsheet...

...NT servers. To escape the ordeal, many institutional investors are outsourcing the task. Pension funds, **mutual funds** and asset **management** firms are licensing the right to use Web-based dial-up analytic engines.

Search Report from Ginger D. Roberts

For example...

...up the project. "In addition, clients can take advantage of Bankers Trust's years of risk management expertise and data history." Other firms are looking for more specialized Web-based analytics. Hartford...

...Web-based tools to document and track financial instruments. For example, BCI expects to go live with Reuters' newly upgraded Kondor+, which features Internet capabilities, in an effort to communicate and...

...automatic environment. This is required for internal purposes and by government bodies that demand a transparent approach to calculating intra-day risks."

**Catastrophe Bonds, Anyone?**

Investment Dealers' Digest

July 28, 1997 VOL: 63 ISSUE: 30 DOCUMENT TYPE: NEWSLETTER

PUBLISHER: INVESTMENT DEALERS DIGEST

LANGUAGE: ENGLISH WORD COUNT: 2650

RECORD TYPE: FULLTEXT

(c) INVESTMENT DEALERS DIGEST All Rts. Reserv.

TEXT:

...securitization faltered, in part because investors weren't ready to take a gamble on a **bond** tied to the weather. But when the sell side started to refine its strategy and...

...agencies got more involved, investors began to come around.

The result? Last month, the catastrophe **bond** market finally witnessed what many call its breakthrough deal-a \$477 million securitization of hurricane...

...there are still plenty of investors who are skeptical about the whole concept of catastrophe **bonds**. "We just felt that we couldn't analyze the risk," says Joe Lorusso, president of...is born

The concept of tying financial instruments to insurance risk first surfaced in the **derivatives** markets in 1992, when the Chicago Board of Trade started selling **futures** contracts linked to insurance risk.

The contracts were a direct result of Hurricane Andrew, with...

...for reinsurers, too, which generally had to purchase reinsurance from other firms like themselves.

Insurance **derivatives** at first drew considerable interest, but the market wasn't big enough to solve the industry's dilemma. **Bond** market players say the **derivatives** have three drawbacks: The buyer base for **futures** is limited; the market only allows for small deals; and contracts are tied only to...

...insurer's book of business-which makes loss triggers slightly ambiguous.

Not long after insurance **derivatives** entered the picture, insurers began to consider the possibility of some sort of catastrophe **bond**. That largely intellectual exercise gained a sense of urgency after the Northridge earthquake in 1994...

...alternative risk-transfer mechanisms," says Dan Rosenbaum, general manager of the capital markets group at **Risk Management Solutions Inc.**, which develops models for catastrophe risk.

After a series of failed attempts that began in 1995, the catastrophe **bond** market appeared to be ready for liftoff last spring. Merrill initially tried to underwrite USAA...

...offered the CEA a better deal.

Germany's Hannover Reinsurance sold a \$100 million catastrophe **bond** deal via Citibank last December, but the transaction went unnoticed by some market players since it was purchased on swap.

But even while the catastrophe **bond** market was faltering in its initial attempts at liftoff, those first offerings were educating investors...a three-year principal-at-risk class.

While the St. Paul Re issue put catastrophe **bonds** on the map, the transaction was too small for Wall Street to sit up and...

...protection, a costly disaster could mean losing all of their investment, while even principal-protected **bonds** don't guarantee interest payments.

"You encounter a number of biases, and they are all understandable," says Merrill's Normile.

The fundamental challenge with catastrophe **bonds** is that natural disasters are basically unpredictable, and their potential damages limitless. "Catastrophes are such..."

...to USAA on its securitization, sell siders have attempted to show investors that buying catastrophe **bonds** isn't a total crapshoot.

And now that the rating agencies-through their reliance on the risk modeling companies-have developed a methodology for analyzing so-called "cat" **bonds**, more investors are showing interest. But, as always with any new asset class, they're...

...agency is valuable in helping an investor get a feel for the risk in the **security**," Shimpi says. "But the ultimate responsibility lies with the investor."

By using various structural features, underwriters have been able to calm some of the fears associated with catastrophe **bonds**. In the USAA deal, for example, Merrill used a conservative loss trigger that, unlike in...get a handle on the risks involved, there appears to be a growing number of **bond** buyers who want to make catastrophe **bonds** a sizable part of their portfolio. In May, for instance, PXRE Corp. and Phoenix Home Life Mutual Insurance Corp. formed a joint venture called **Cat Bond Investors** that specializes in catastrophe **bond** investments.

But more importantly, catastrophe **bonds** have been bought by a truly diverse group of investors. Sources say the USAA deal...

...appears that insurance companies have received a green light of sorts to buy the new **bonds**. A few weeks before the Swiss Re transaction, the National Association of Insurance Commissioners said it would view the earthquake **securities** as **bonds**, and not as equity investments. This means insurance companies won't have to set aside...

...all these positives, some investors still have nagging concerns. For starters, as with any new **bond** type, catastrophe **bonds** don't really have much of a secondary market. And with so few deals having...

...opting to stay out of the market until more transactions hit the tape.

"Could we live with the structure? We probably could," says Frank Riccardi, senior managing director at Key Asset Management. "But for a new product, a new instrument in the market, we tend to watch the first couple of deals go by, and see how the market trades them."

Still, bullish underwriters and investors maintain that the bonds already have trading value. "You're seeing trading of these bonds in the secondary market," says an investor in the USAA deal.

Another plus that bodes...

...portfolios. Investors in the USAA deal, for example, may want to vary their investments with bonds securitized by other types of catastrophic risk, or tied to another region.

"There's a base of investors who are looking for diversification within their insurance securities portfolio," Kaiser says.

What next?

While it's unclear how quickly this market will develop, the probability of more catastrophe bond transactions this year is pretty good. Underwriters and rating agency officials say there are several...

...participation in the public arena. But in the near future, it's likely that catastrophe bonds will stay in the private and 144A markets.

"An issuer can get very good execution..."

...the spread give-up is very limited" when compared with the public market.

Though catastrophe bonds are still in their infancy, firms and rating agencies alike seem to ... of Wall Street's imagination have the power to restrain the potential growth of these bonds .

"I'm confident that the major players [in the insurance industry] are not confining their...

TEXT:

...and financial affiliates - of one of these sprawling entities which might include banking, fund management, **securities** and **commodities** trading, and insurance. Indeed, it might be dangerous to try.

"Over-supervision can disrupt the...

...with anything that threatens to jolt the financial system.

Baring gifts

The world's banking, **securities** and insurance supervisors and the authorized exchanges were moving towards this anyway, so they say...

...of standards that might minimize shocks without distorting markets.

At a meeting in May 1995, **securities** regulators from 16 countries signed the so-called Windsor Declaration, calling for closer cooperation and better information-flow between **futures** exchanges, and better procedures in cases of insolvency. The **Futures** Industry Association (FIA) launched a "global task force" in March 1995 which, by June, had produced recommendations on financial integrity for **futures** and **options** markets, and their participants. Within a year, some 55 exchanges had signed a cooperation agreement on information-sharing.

In July 1995 the so-called Tripartite Group of bank, **securities** and insurance regulators published a report on the supervision of financial conglomerates. It recommended ...nine-person joint forum representing the Basle Committee on Banking Supervision, the International Organization of **Securities** Commissions (Iosco), and the International Association of Insurance Supervisors (IAIS). The forum is now up...

...and "asked intelligent questions about management and reports", says a Goldman Sachs source. The UK **Securities** & Investments Board (SIB) and US **Securities** & Exchange Commission (SEC) selected two guinea-pig firms for a thorough study of how such...

...special adviser to the SIB.

The practitioners too have sought to make their industry more **transparent** to regulators and end-users - and to each other - by issuing their own guidelines. The G30 report on **derivatives** practices and principles, produced in July 1993, was the first attempt to fight fire with...

...a crackdown by regulators. It offered a set of principles for the management of a **derivatives** trading operation. In March 1995 the **Derivatives** Policy Group (DPG), drawn from six US **securities** firms, produced

## Search Report from Ginger D. Roberts

Framework for Voluntary Oversight, a code for better disclosure of their over-the-counter (OTC) derivatives activities which they mostly book in unregulated affiliates. Quarterly reports by these firms give more information on total marked-to-market exposure to derivatives counterparties and their credit ratings, but there is still little on daily market risk...

...Since Barings, the focus has shifted somewhat from number-crunching exercises and the bugbear of derivatives to a broader view of market and credit risk management, operational risk and control, standards of business conduct, and even the culture of an institution...above market risk; mastering information-flow, systems, command structure, independent oversight and risk control; and monitoring the culture fostered by the people at the top. Just as an exceptional gymnast performing...

...flying trapeze, so a complex financial institution needs up-to-the-minute - and, if possible, real - time - information, to assure its performance and to avoid a crash. Supervisors shouldn't aspire to...

...and making directors de facto supervisors can shift the supervisory burden closer to the market.

### Risk management ratings

These concepts don't cut much ice in the US or the UK. But...

...publicly for their management controls. In the US, the Office of the Comptroller of the Currency (OCC) and the New York Federal Reserve have gone some way towards this by ranking...seeks to guarantee that vehicles are roadworthy at all speeds."

There is a danger of risk management theories, techniques and numbers getting too specific. Mark Brickell, managing director at JP Morgan, and former chairman of the International Swaps & Derivatives Association (Isda), argues for regulatory diversity which allows "each regulator to specialize in a particular..."

...ideal micro-model for audit and supervision of complex financial activity is the triple-A derivative products company (DPC) as set up by a dozen or so banks and investment banks...The regulator's ultimate sanction, if it finds the structure of a group not sufficiently transparent, is to withhold authorization from the regulated affiliate. This is a very blunt instrument: supervisors...

...an exchange-traded transaction has occurred? For example, if the Italian branch of a British securities firm uses a remote terminal to trade a German Bund future for a customer in...

...transaction take place, which supervisor has oversight of the trader's conduct and which supervisor monitors the integrity of the deal? Does an exchange have supervisory powers over a dealer in...information. The agony of the global regulator continues.

ABSTRACT EP 350208 A2

A real-time database provides the predictable, high speed data access required for on-line applications, while providing flexible searching capabilities. The data retrieval routines include the option to "read-through-lock" to access data in locked data tables, the capability to directly access to data using tuple identifiers, and the capability to directly access unformatted data from input areas which contain blocks of unformatted data. The data updating routines include an option to omit index updating when updating data and an option to update data in a locked data table. Multiple indexes can be defined for a data table. Thus, high speed searches can be performed based on a variety of data fields. The data storage and retrieval mechanisms are independent and there are hash index tables that connect the multiple index keys to the data tables. The data table structure includes a column defined for storing tuple identifier strings. These tuple identifiers can be used as pointers for chaining to related data stored in other data tables. The database has relatively small programmatic memory. There is a common structure for user data tables, index tables and system tables. The database includes a minimum number of routines with certain routines providing multiple functionality.

English Abstract

This invention provides methods and system for trading and investing in groups of demand-based adjustable return contingent claims, and for establishing markets and exchanges for such claims (262, 263, 264, 265). The advantages of the present invention, as applied to the derivative securities and similar financial markets, include increased price transparency, reduced credit risk, improved information aggregation, increased price transparency, reduced settlement or clearing costs, reduced hedging costs, reduced model risk, reduced event risk, increased liquidity incentives, improved self-consistency, reduced influence by market makers, and increased ability to generate and replicate arbitrary payout distributions. In addition to the trading of derivative securities, the present invention also facilitates the trading of other financial-related contingent claims; non-financial-related contingent claims such as energy, commodity, and weather derivatives; traditional insurance and reinsurance contracts; and contingent claims relating to events which have generally not been readily insurable or hedgeable such as corporate earnings announcements, future semiconductor demand, and changes in technology.

French Abstract

La presente invention concerne des procedes et des systemes de negociation et d'investissement dans des groupes de requetes de contingents de recettes ajustables, fonction de la demande, et d'establissemement de marches et d'echanges pour ces requetes (Figure 2, article 262, 263, 264, 265). Les avantages de la presente invention, tels qu'appliques aux titres derives et aux marches financiers similaires, comprenant des risques de credit reduit, un recouplement d'informations ameliore, une plus grande transparence des prix, des couts reduits d'installation ou de compensation, des couts reduits de couverture, des risques de modeles reduits, des risques d'imprevus reduits, des primes de rendement augmentees, une plus grande coherence interne, une influence reduite des teneurs de marche, et une plus grande capacite a generer ou repeter des distributions de revenus arbitraires. En outre, pour le marche des titres derives, la presente invention facilite egalement la negociation d'autres requetes de contingents financiers, et non financiers tel que l'energie, les marchandises, les derives dependant des conditions meteorologiques; l'assurance classique et les contrats de reinsurance; ainsi que les requetes de contingents liees a des evenements n'ayant pas pu etre assures ou couverts de maniere adequate, tels que des annonces de benefices commerciaux, des demandes de semi-conducteurs futurs et des progres technologiques.

English Abstract

A system and method (Fig. 1) is provided to engage in capital market transactions via the Internet (10). Through a system of servers (20, 90), application (3280), and interfaces (3275), financial instrument trading (160), portfolio management (170), and financial analyses (190) are seamlessly performed. Automated communications (1070) enabling connectivity with user systems (1150) are facilitated using XML-based syntax (Fig. 10) and XSL-based programming language.

French Abstract

La presente invention concerne un systeme et un procede permettant d'operer des transactions sur le marche des capitaux par l'intermediaire d'Internet (10). Un systeme de serveurs (20, 90), d'applications (3280) et d'interfaces (3275) permet d'effectuer des echanges d'instruments financiers (160), de la gestion de portefeuilles (170) et des analyses financieres (190) en continu. Les communications automatisees (1070) offrant une connectivite avec des systemes utilisateur (1150) sont ameliorees au moyen d'une syntaxe XML (Fig. 10) et d'un langage de programmation XSL.

English Abstract

A computer-implemented system (100) and method having a graphical user interface with multiple windows for electronic securities trading (101) that consolidates information the investor needs for trading. It

Search Report from Ginger D. Roberts

automatically and continuously retrieves and displays updated information that the investor needs for executing trades in a way that is transparent to the user. The system provides real - time portfolio management and accounting. The software program contains multiple windows for simultaneously allowing display of investor positions, balances, trade status, news (106) and research. Investors can perform investment research, enter orders, obtain real - time quotes (110, 111), view current position, pending orders, cash and margin balances, market data, dynamic charts and online news and reports using multiple windows on one computer screen. The program facilitates automatic management of trading orders and monitoring positions ( securities inventory) without the presence of the user.

French Abstract

L'invention concerne un systeme (100) et procede informatiques dotes d'une interface graphique d'utilisateur a plusieurs fenetres, destines au commerce electronique de titres (101) qui integrent des informations dont l'investisseur a besoin pour faire des affaires. Ledit systeme extrait et affiche automatiquement et continuellement des informations mises a jour dont l'investisseur a besoin pour faire des affaires d'une facon transparente vis-a-vis de l'utilisateur. Ce systeme realise la gestion et la reddition de comptes d'un portefeuille en temps reel. Le programme informatique comprend de nombreuses fenetres permettant simultanement l'affichage des positions, des soldes, du statut commercial, des nouvelles (106) et des recherches concernant l'investisseur. Les investisseurs peuvent realiser des recherches ayant trait a l'investissement, entrer des commandes, obtenir des cours en temps reel (110, 111), visualiser la position actuelle, des ordres en attente, des soldes des marges et des disponibilites, des donnees du marche, des graphiques dynamiques, des nouvelles en ligne et des rapports au moyen de nombreuses fenetres sur un ecran d'ordinateur. Le programme facilite la gestion automatique des ordres commerciaux et des positions de controle (inventaire des titres) en l'absence de l'utilisateur.

**English Abstract**

An Internet-protocol based anonymous trading system which enables traders to identify bids and offers which they are eligible to trade based upon a color coded methodology which gives the trader credit preference information about the potential counterparty while still maintaining the anonymity of the potential counterparty. To that end, each bid or offer is prescreened against all possible counterparties' credit information in the system and each counterparty sees a unique color coded trading interface based upon their particular credit preference combinations and the others in the system. The system then shows all prices in the system, and the color-coding tells the trader which prices he is able to trade, and also shows him the full depth of the market, including those the trader is unable to trade.

**French Abstract**

Système de négociation anonyme basé sur un protocole Internet, qui permet à des négociateurs d'identifier les soumissions et les offres pour la négociation desquelles ils sont éligibles. Le système est basé sur une méthodologie de codes de couleurs, qui donne au négociateur des informations de préférence de crédit sur les contreparties éventuelles, tout en conservant l'anonymat desdites contreparties. A cet effet, chaque soumission ou offre est préalablement examinée à la recherche de toutes les informations de crédit des contreparties du système, et chaque contrepartie voit une interface de négociation avec un code d'une seule couleur sur la base de ses propres combinaisons de préférences de crédit et de celles des autres participants au système. Le système présente ensuite tous les prix, et le codage par couleurs indique au négociateur quels prix il est capable de négocier et lui montre la totalité du marché, y compris les prix qu'il est incapable de négocier.

English Abstract

A system and method of accepting risk (14) through contractual obligations, then transferring all or a portion of the risk to investors which includes a means of absolute assurance of timely payment to contractholders, and segregation of the interests of particular investors to specifically identified risks in a risk to capital matching system. Segregated reserves are used to tailor particular products for specific needs and, in particular, the need of transferring difficult to place risks. Agreements are created which promise payments, based on loss from risks including investment risk such as unexpected stock dividend changes; variations in returns on marketable debt obligations and currency fluctuations (13). The entity provides a unique service of guaranteeing payments for losses and investment performance payments by setting aside reserves fully adequate to meet the maximum of each and every obligation (14).

French Abstract

La presente invention concerne un systeme et un procede d'acceptation de risque (14) par des obligations contractuelles, et de transfert ultérieur de tout ou partie du risque a des investisseurs. Le systeme comporte un moyen d'assurance absolue du paiement ponctuel aux parties contractantes et d'affectation exclusive des interets d'investisseurs determinees a des risques identifies de maniere specifique, dans un systeme de correspondance entre risque et capital. Des reserves distinctes sont utilisees pour realiser sur mesure des produits particuliers destines a des besoins specifiques et, en particulier, la necessite de transferer des risques difficiles a placer. Des accords sont crees, qui promettent des paiements, bases sur les pertes dues a des risques, dont les risques d'investissement tels que les variations imprévues des dividendes en actions, les variations de rendement sur les titres de creance de placement et les fluctuations des cours des devises (13). L'ensemble donne un service unique de garantie des paiements pour pertes et des paiements d'execution d'investissements, grace a la constitution de reserves entierement appropriees pour faire face au maximum de tout titre (14).

English Abstract

A data processing system and method is disclosed for implementing and control of a financial debt instrument which is listed for a limited period of time and is traded as a listed security (20). The debt instrument is based on an underlying basket of stocks optimally selected to track an established capital market (1) and its price also reflects accrued investment income and maintenance expenses. The data processing system receives input from the capital market and periodically evaluates the performance of the financial debt instrument, reporting its price to customers (5). Also disclosed is a data processing system for administering an investment group of such debt instruments designed to track the performance of several domestic and foreign markets, estimate their return and provide current price information to customers.

French Abstract

Système et procède de traitement de données permettant de mettre en oeuvre et de gerer un titre de créance inscrit en bourse pour une période limitée et négocie sous forme d'une valeur cotée (20). Ce titre de créance est émis en fonction d'un portefeuille d'actions sous-jacent sélectionné de façon optimale afin de suivre un marché financier établi (1), et sa valeur reflète également les frais de maintenance et les revenus d'investissement accumulés. Ce système de traitement de données reçoit des données en entrée du marché financier et évalue périodiquement les performances du titre de créance, communiquant sa valeur aux clients (5). L'invention se rapporte également à un système de traitement de données permettant de gerer un groupe d'investissement de tels titres de créance, conçu pour suivre les performances de plusieurs marchés nationaux et étrangers, évaluer leur rendement et fournir aux clients des informations relatives aux prix courants.

Fulltext Word Count: 41169

English Abstract

Methods and apparatus which deal with the management of risk relating to specified, yet unknown, future events are disclosed. "Sponsor" stakeholders (12) specify a particular product relating to an event or phenomenon for which there is a range of possible future outcomes.

"Ordering" stakeholders (13) then offer contracts relating to the predetermined phenomenon and corresponding range of outcomes. The offered contracts specify an entitlement (or pay-off) at the future time of maturity for each outcome, and a consideration (or premium) payable, in exchange, to a "counter-party" stakeholder (14). Independently of the offered contracts, the "counter-party" stakeholders (14) input data as to their view of the likelihood of occurrence of each outcome in the predetermined range into the future, or specifically at the predetermined date of maturity. Each offered contract is priced by the processing units (20) by calculating counter-party premiums from the registered data, and a match attempted by a comparison of the offered premium with the calculated premiums. Matched contracts can be further traded until maturity, and at-maturity processing handles the exchange of entitlement as between the matched parties to the contract.

French Abstract

Le procede et l'appareil decrits permettent d'assurer la gestion de risques concernant des evenements a venir et jusqu'alors inconnus. Les participants "garants" (12) fournissent la description d'un produit specifique concerne par un evenement ou un phenomene pour lesquels on peut predire plusieurs issues. Les participants "ordonnateurs" (13) proposent alors des contrats prenant en consideration le phenomene tel qu'il a ete defini et l'ensemble des issues previsibles. Les contrats proposes specifient un droit (ou un dedommagement) a l'echeance de chacune des issues a venir, et une provision (ou indemnite) dus, en compensation, a un participant "contrepartie" (14). Independamment des contrats proposes, les participants "contrepartie" (14) introduisent des donnees precisant leurs leurs estimations soit quant a la probabilite de survenu de chacune des issues previsibles, soit, de facon plus specifique, quant a cette survenu a la date d'echeance prevue. Le calcul du prix de chacun des contrats est effectue au moyen d'unites de traitement (20) qui calculent les indemnites des contreparties a partir des donnees enregistrees, et un essai d'adaptation est realise sur la base d'une comparaison entre les indemnites offertes et les indemnites calculees. Les contrats ayant fait l'objet d'une telle adaptation peuvent ensuite donner lieu a renegociation jusqu'a la date d'echeance. A la date d'echeance, le traitement informatique assure la compensation des droits entre les parties au contrat concernees par l'adaptation.
